

Charleston Solar Path Lights

Introduction

Solar lights work by using electricity generated by the solar panel to charge internal batteries. These batteries are then used to power the light. When switched on the lights automatically illuminate at night by using a sensor. The duration of illumination will depend on the amount of sunlight and therefore charge received by the batteries.

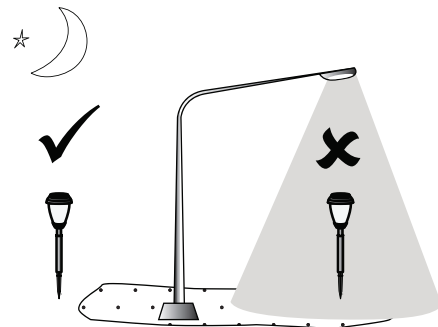

Contents

Position

Position the light to receive the maximum amount of sunlight.

Do not position under bright light as this will prevent the light switching on at night.

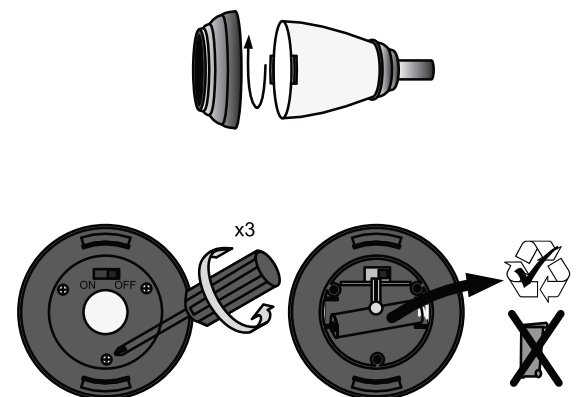

First Use

Although there may be some charge left in the battery we recommend fully charging it before first use. Leave the switch in the off position for 2 sunny days to ensure the battery is fully charged. Once fully charged switch to on position. The light will now automatically illuminate when it gets dark. You can cover the solar panel to test that the light is operating.

Battery

Rechargeable batteries become less efficient with repeated charge-discharge cycles and the battery capacity reduces. If you find that the battery appears to be less efficient or does not run for long we suggest you first try to boost charge it. Switch off for 3 to 5 sunny days to allow the maximum charge to the battery. If after this boost charge your battery still does not perform to expectations you should replace it. To change the battery remove the 3 screws on the underside of the top to remove the battery cover.

Remove the existing battery and replace with a new one. Only use Ni-MH or Ni-Cd rechargeable batteries. Please ensure that the battery is disposed of according to local regulations.
